Scottish Journal of GEOLOGY
Volume 45, Part 2, pages 97–192
2009

Published by the Geological Society Publishing House for the Geological Societies of Edinburgh and Glasgow
The Scottish Journal of Geology continues the Transactions of the Edinburgh Geological Society and the Transactions of the Geological Society of Glasgow, and is sponsored by the councils of the two societies. It contains two parts per volume. The Journal is open to members of both societies. Details of membership may be obtained from the secretaries, whose names appear below.

Contributions or legacies to assist towards the cost of publication of the Journal would be welcomed by the Editorial Board.

Front cover illustration

The image on the front cover shows a hill-shaded digital surface model, built from NEXTMap Britain topographic data (collected by Intermap Technologies). It depicts an area of the NW Highlands 50 × 35 km in size, centred on Ullapool and the twin fjords of Loch Broom and Little Loch Broom. The Moine Thrust Zone runs roughly NNE–SSW through the middle of the image, separating areas of significantly different size, centred on Ullapool and the twin fjords of Loch Broom and Little Loch Broom. The Moine Thrust Zone runs roughly NNE–SSW through the middle of the image, separating areas of significantly different geology and landscape. To the west of the thrust zone are rolling hills underlain by psammites of the Moine Supergroup, culminating in the Beinn Dearg massif in the SE of the image. To the west of the thrust zone, castellated peaks of Torridon Group sandstone, such as An Teallach and Ben Mòr Coigach, rise as inselbergs above the Lewisian Gneiss Complex basement. Evidence for glaciation is striking. Large-scale streamlined features in the lee of hills like Stac Pollaidh and Bheinn Ghobhach show the broad sweep of the last ice sheet from east to west. Glacially sculpted bedrock is seen on many scales – from large flutings and kilometre-long megagrooves NE of Ullapool, to smaller-scale roche moutonnées and whalebacks further SW around Gruinard Bay. These features formed at the base of a mobile ice sheet and are primary evidence of the palaeo-ice stream which drained much of NW Scotland during the last glaciation. (Goodenough et al. 2009. Digital surface models and the landscape. Scottish Journal of Geology, 45, 99–105)

Notes to assist authors planning to submit items for publication in the Scottish Journal of Geology

Aim: The primary aim of the Journal is to publish papers relevant to the geology of Scotland and adjacent areas including the surrounding seas. Papers of general or specialist interest as well as short communications, letters to the editor, and discussions of earlier papers are welcome, together with reviews and thematic sets publishing the results of relevant meetings and conferences.

Submission: All contributions must be original. Papers, including figures and references should not normally exceed 12 printed pages. A pdf or Word file of the typescript should be sent to The Editors, Scottish Journal of Geology, Geological Society Publishing House, Unit 7, Brassmill Enterprise Centre, Brassmill Lane, Bath BA1 3IN. No hard copy is required. Joint authors should indicate to whom proofs and correspondence should be sent.

Format: A pdf of the paper may be submitted for review purposes. On acceptance, MS Word files of the text, captions and tables are required along with a complete copy of the full manuscript. Typescripts should be double-spaced throughout (including references) on A4 paper, on one side of the paper only, with a 25mm margin on each side. All pages should be numbered serially.

Title: brief and specific. Name(s) and address(es) of author(s) (including an email address for the corresponding author). Synopsis: must be intelligible without reference to the paper and should not exceed 200 words. Main body of paper, subdivided into 1st, 2nd, and 3rd order headings (see recent issue for styles).

Acknowledgements: Appendices. References: NAME, A. B. Year. Title. [In Name, C. D. & Name E. F. (eds) Title. Publisher, place, pages.]

Text: Authors should ensure consistency in their use of capitals, hyphens and punctuation. Underlining should be used only to indicate words in italics, e.g. fossil names. Footnotes should be avoided. References in the text should be separated by a semicolon and appear in chronological order (Hutton 1795; Hutton & Smith 1805; Werner 1874). Reference in the text to papers with more than two authors should be made thus: (Smith et al. 1975) but cited in full in the reference list.

References: List all references cited in text, figures, and tables. They should be double spaced, in alphabetical order of the author’s names with ‘et al.’ entries listed chronologically. Repeated author names and journal titles should be given in full. Unpublished material and manuscripts submitted to a journal but not yet accepted should not be cited. Personal communications are preferable to inaccessible unpublished reports.

Figures: Page size is 252 x 176 mm; column width is 85mm. Figures should be prepared to fit either a page or column width leaving space for the caption. They must be numbered consecutively and referred to in the text in that order. Make sure that scales and north arrows are included where appropriate. Please provide print outs that are exactly the same as the material on the disc. Acceptable graphics packages are Corel Draw, Adobe Illustrator and Aldus Freehand. Ensure that fine lines are saved as actual line widths of at least 0.5 pt. Do not use fine-line default settings (minimum width or hairline) or fine-inking on a high-resolution output device such as a film-setter they may be too fine to show up in print. This problem cannot be detected in proofs, which are produced with a laser printer. No letters, after reduction, should be less than 1mm high.

Figures should be supplied as EPS files with fonts embedded and a tiff preview. If EPS files are not an option, we can accept high resolution (1000 dpi) bit map TIFFs (or JPEG, GIF).

Photographs or halftones can be provided as EPS or greyscale TIFF files (recommended resolution >300dpi). A scale bar should be used on photographs.

Colour may be used, but authors wishing to do so must contact the editors. Authors are expected to contribute towards the cost of colour reproduction. Similarly, folded figures are expensive, and editors must be consulted. Colour must be saved as CMYK (not RGB).

Tables: Tables should go across single or double column width. Vertical and horizontal rules should be avoided. Tables must be provided as Word, Excel or rtf files.

Supplementary publication scheme: Detailed material such as locality lists and analytical data, will be made available as Supplementary Publications. These files are hosted on the Society’s website. Acceptable formats for the online repository are: .rtf, .csv and .pdf. Maximum size is 5 MB per paper (can be zipped if necessary).

Offprints/pdfs: Offprint copies of papers will be provided at cost of ordered when the corrected proofs are returned to the publisher. Copies are normally distributed soon after publication. The journal is available online through ingentaconnect (www.ingentaconnect.com/journals/browse/geol/sjg) and will be listed on the Lyell Collection from November 2009. Authors will be sent instructions on how to obtain pdfs.

Copyright: The Scottish Journal of Geology is the joint property of the Geological Society of Glasgow and the Edinburgh Geological Society, in whom the copyright rests. Queries regarding copyright should be directed to the secretaries of the Societies. Papers accepted for publication are deemed to be the property of the Editorial Board acting on behalf of the Societies unless specific arrangements are made to the contrary.

More information, including contents of recent issues can be found on the Journal’s WWW page: http://www.geolsoc.org.uk/pdfpublications/journal/sjg
